

IPOL® (Poliovirus Vaccine Inactivated)

IPOL is indicated for active immunization of infants (as young as 6 weeks of age), children, and adults for the prevention of poliomyelitis caused by poliovirus Types 1, 2, and 3.

IMPORTANT SAFETY INFORMATION FOR IPOL® (Poliovirus Vaccine Inactivated)

IPOL should not be administered to anyone who has had a severe allergic reaction to any component of the vaccine, including 2-phenoxyethanol, formaldehyde, neomycin, streptomycin, and polymyxin B.

No further doses should be given if anaphylaxis or anaphylactic shock occurred within 24 hours of administration of 1 dose of vaccine.

Although no causal relationship between IPOL and Guillain-Barré Syndrome (GBS) has been established, GBS has been temporally related to administration of another inactivated poliovirus vaccine.

The most common local and systemic adverse reactions to IPOL include pain, erythema, and induration at the injection site; fever, irritability, sleepiness, fussiness, and crying. Other adverse reactions may occur. Vaccination with IPOL may not protect all individuals.
